

§4. 相对论电动力学

一. 闵可夫斯基空间.

(1). 比约肯度规:

$$g^{\mu\nu} = g_{\mu\nu} = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & -1 & 0 & 0 \\ 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & -1 \end{pmatrix}$$

爱因斯坦求和关系:

$$X_\mu = g_{\mu\nu} X^\nu = \sum_{\nu=0}^3 g_{\mu\nu} X^\nu$$

(2)

$$\begin{aligned} \text{上逆下协} \quad \begin{cases} X^\mu = (x^0, x^1, x^2, x^3) \\ X_\mu = (x_0, x_1, x_2, x_3) \end{cases} &\stackrel{\text{关系}}{\Rightarrow} \begin{cases} X_\mu = g_{\mu\nu} X^\nu \\ X^\mu = g^{\mu\nu} X_\nu \end{cases} \Rightarrow \begin{cases} X^\mu = (x^0, x^1, x^2, x^3) \\ X_\mu = (x_0, x_1, x_2, x_3) \\ = (x_0, -x_1, -x_2, -x_3) \end{cases} \end{aligned}$$

(3) 两个四维矢量的点积:

$$\cancel{X} = (\cancel{x_0}, \cancel{x_1}, \cancel{x_2}, \cancel{x_3}) \quad X = (x^0, x^1, x^2, x^3), \quad Y = (y^0, y^1, y^2, y^3)$$

$$X \cdot Y = g_{\mu\nu} X^\mu Y^\nu = x^0 y^0 - x^1 y^1 - x^2 y^2 - x^3 y^3$$

(4). 洛伦兹变换:

→ 可保持间隔不变.

$$X^\mu \rightarrow X'^\mu = \Lambda^\mu_\nu X^\nu$$

$$\text{定义无穷小间隔: } d's = g_{\mu\nu} dX^\mu dX^\nu = g_{\alpha\beta} dX'^\alpha dX'^\beta$$

$$\text{由于洛伦兹变换后间隔不变: 有 } g_{\mu\nu} \Lambda^\mu_\alpha \Lambda^\nu_\beta = g_{\alpha\beta}$$

(5) 张量场:

A. 零阶 ~ (标量): $f(x)$

$$\begin{cases} X^\mu \rightarrow X'^\mu = \Lambda^\mu_\nu X^\nu \\ f(x) \rightarrow f'(x') = f(x) \end{cases}$$

∴ $f(x)$ 只有 1 个分量 (4), 洛伦兹变换下不变

洛伦兹不变量只能是标量.

B. - 阶 ~ (矢量): $A^\mu(x)$

$$\begin{cases} X^\mu \rightarrow X'^\mu = \Lambda^\mu_\nu X^\nu \\ A^\mu(x) \rightarrow A'^\mu(x') = \Lambda^\mu_\nu A^\nu(x) \end{cases}$$

特点: ① $A^\mu(x)$ 有 4 个分量 $A^0(x), A^1(x), A^2(x), A^3(x)$

$$X = (x_0, x_1, x_2, x_3)$$

② 洛伦兹变换下是协变的

C. 二阶 ~ (eg. 电磁场): $T^{\mu\nu}(x)$

$$\begin{cases} X^\mu \rightarrow X'^\mu = \Lambda^\mu_\nu X^\nu \\ T^{\mu\nu}(x) \rightarrow T'^{\mu\nu}(x') = \Lambda^\mu_\alpha \Lambda^\nu_\beta T^{\alpha\beta}(x) \end{cases}$$

特点: 有 10 个分量.

③ 洛伦兹变换下是协变的

(6) 快度:

$$\theta = \frac{1}{2} \ln \frac{1+\frac{v}{c}}{1-\frac{v}{c}}, \quad \beta = \frac{v}{c}$$

$$v = c \cdot \tanh \theta$$

相对论因子

16. 梯度与散度.

$$\textcircled{1} \begin{cases} 4\text{-d协变梯度算子: } d_\mu = \frac{\partial}{\partial x^\mu} = (\frac{1}{c} \frac{\partial}{\partial t}, \vec{\nabla}) \\ \text{逆变: } \partial^\mu = \frac{\partial}{\partial x_\mu} = (\frac{1}{c} \frac{\partial}{\partial t}, -\vec{\nabla}) \end{cases}$$

②. 达朗贝尔算子:

$$\begin{aligned} \square^2 &= d_\mu \partial^\mu = \frac{\partial^2}{\partial (x^0)^2} - \frac{\partial^2}{\partial (x^1)^2} - \frac{\partial^2}{\partial (x^2)^2} - \frac{\partial^2}{\partial (x^3)^2} \\ &= \frac{1}{c^2} \frac{\partial^2}{\partial t^2} - \vec{\nabla}^2 \end{aligned}$$

17. 本征洛伦兹变换:

17. 空间旋转对称性: $\Rightarrow$ 暗含相对论的本质.

1. 本征洛伦兹变换:

将洛伦兹变换变成 4-d 形式, 引入相对论因子 $\beta = \frac{v}{c}$, 洛伦兹因子: $\gamma = \frac{1}{\sqrt{1-\beta^2}}$

$$\therefore x^\mu \rightarrow x'^\mu = \Lambda^\mu_\nu x^\nu \quad \Lambda^\mu_\nu \text{ (速度沿 } x \text{ 轴的旋转矩阵)}$$

$$\begin{pmatrix} x^0 \\ x^1 \\ x^2 \\ x^3 \end{pmatrix} = \begin{pmatrix} \gamma & -\gamma\beta & 0 & 0 \\ -\gamma\beta & \gamma & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x^0 \\ x^1 \\ x^2 \\ x^3 \end{pmatrix}$$

引入快度 $\theta \Rightarrow \gamma\beta = \sinh\theta$

$$= \begin{pmatrix} \cosh\theta & -\sinh\theta & 0 & 0 \\ -\sinh\theta & \cosh\theta & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x^0 \\ x^1 \\ x^2 \\ x^3 \end{pmatrix}$$

②. 动力学部分:

A. 四维无穷小位移: $dx^\mu = (cdt, d\vec{x})$

$$dx_\mu = (cdt, -d\vec{x})$$

4-d 无穷小间隔: $d^2s = dx_\mu dx^\mu = c^2 d\tau^2 - d^2\vec{x}$

无穷小固有时间间隔: $c^2 d\tau^2 \equiv d^2s = c^2 dt^2 - d^2\vec{x}$

$$\begin{aligned} \Rightarrow d\tau &= \sqrt{1 - \frac{u^2}{c^2}} dt \\ &= \frac{1}{\gamma_u} dt \end{aligned}$$

B. 4-d 速度矢量:

$$\eta^\mu = (\eta^0, \eta^1, \eta^2, \eta^3)$$

$$= \frac{dx^\mu}{d\tau}$$

$$= \left(\frac{dx^0}{d\tau}, \frac{d\vec{x}}{d\tau} \right)$$

$$= (\gamma_u c, \gamma_u \vec{u})$$

$$\therefore \eta_\mu \eta^\mu = \gamma_u^2 c^2 - \gamma_u^2 \vec{u}^2 = c^2$$

洛伦兹不变量.

$$\text{洛伦兹变换: } \eta^\mu \rightarrow \eta'^\mu = \Lambda^\mu_\nu \eta^\nu$$

A C. 4-d 动量:

$$\begin{aligned} p^\mu &= (p^0, p^1, p^2, p^3) \equiv m\eta^\mu \\ &= (m\gamma^0, m\vec{\gamma}) \\ &= \left(\frac{mc}{\sqrt{1-\frac{u^2}{c^2}}}, \frac{m\vec{u}}{\sqrt{1-\frac{u^2}{c^2}}} \right) \\ &= \left(\frac{E}{c}, \vec{p} \right) \end{aligned}$$

洛伦兹变换: $p^\mu \rightarrow p'^\mu = \Lambda^\mu_\nu p^\nu$

将 $\begin{pmatrix} -\gamma\beta & \gamma \\ \gamma & -\gamma\beta \end{pmatrix}$ 代入

Q. $p^\mu p_\mu p^\mu = \frac{E^2}{c^2} - p^2$
 $= m^2 \eta^\mu \eta_\mu = m^2 c^2 \} \Rightarrow$ 爱因斯坦质壳关系: $E^2 = p^2 c^2 + m^2 c^4$

第二个洛伦兹变换:

$$\begin{cases} E' = \frac{E - p_x v}{\sqrt{1 - \frac{v^2}{c^2}}} \\ p'_x = \frac{p_x - \frac{Ev}{c^2}}{\sqrt{1 - \frac{v^2}{c^2}}} \\ p'_y = p_y \\ p'_z = p_z \end{cases}$$

二. 相对论电动力学.

11. 4-d 电流矢量:

①. 电荷 q : 既是洛伦兹不变量, 也是守恒量.

②. $J^\mu = (J^0, J^1, J^2, J^3) \equiv (\rho c, \vec{j})$

$J_\mu = (\rho c, -\vec{j})$

③. 电流连续性方程: $\partial_\mu J^\mu = 0$

④. 洛伦兹变换:

$J^\mu \rightarrow J'^\mu = \Lambda^\mu_\nu J^\nu$

$\Rightarrow$ 电流的洛伦兹变换:

$$\begin{cases} \rho' = \frac{\rho - \frac{j_x v}{c^2}}{\sqrt{1 - \frac{v^2}{c^2}}} \\ j'_x = \frac{j_x - \rho v}{\sqrt{1 - \frac{v^2}{c^2}}} \\ j'_y = j_y \\ j'_z = j_z \end{cases}$$

这种变换不用记, 由 $0'^\mu = \Lambda^\mu_\nu 0^\nu$
 将 Λ^μ_ν 代入即可得

12) 4-d 电磁势:

★ ①. 定义: $A^\mu = (\frac{\Phi}{c}, \vec{A})$

$A_\mu = (\frac{\Phi}{c}, -\vec{A})$

★ ②. 4-d 电磁势的洛伦兹规范: (不是洛伦兹变换!)

$$\partial_\mu A^\mu = 0 \iff \frac{1}{c^2} \frac{\partial \Phi}{\partial t} + \vec{\nabla} \cdot \vec{A} = 0$$

$\partial_\mu = (\frac{1}{c} \frac{\partial}{\partial t}, \vec{\nabla})$

★ ③. 电磁势的规范变换:

$$A^\mu \rightarrow A'^\mu = A^\mu - \partial^\mu \lambda \iff \begin{cases} \Phi' = \Phi - \frac{\partial \lambda}{\partial t} \\ \vec{A}' = \vec{A} + \vec{\nabla} \lambda \end{cases}$$

★ ④. 电磁势的达朗贝尔方程:

$$\square^2 A^\nu = \mu_0 J^\nu, \quad \nu = 0, 1, 2, 3 \iff \begin{cases} \frac{1}{c^2} \frac{\partial^2 \Phi}{\partial t^2} - \nabla^2 \Phi = \frac{\rho}{\epsilon_0} \\ \frac{1}{c^2} \frac{\partial^2 \vec{A}}{\partial t^2} - \nabla^2 \vec{A} = \mu_0 \vec{J} \end{cases}$$

✓ ⑤. 电磁势的洛伦兹变换:

$$A^\mu \rightarrow A'^\mu = \Lambda^\mu_\nu A^\nu \rightarrow \text{电磁势的洛伦兹变换: } \begin{cases} \Phi' = \frac{\Phi - A_x v}{\sqrt{1 - v^2/c^2}} \\ A'_x = \frac{A_x - \Phi v/c^2}{\sqrt{1 - v^2/c^2}} \\ A'_y = A_y \\ A'_z = A_z \end{cases}$$

13) 4-d 电磁场张量:

★ ①. $F^{\mu\nu} = \partial^\mu A^\nu - \partial^\nu A^\mu \iff \begin{cases} \vec{B} = \vec{\nabla} \times \vec{A} \\ \vec{E} = -\vec{\nabla} \Phi - \frac{\partial \vec{A}}{\partial t} \end{cases}$

$$= \begin{pmatrix} 0 & -\frac{E_x}{c} & -\frac{E_y}{c} & -\frac{E_z}{c} \\ \frac{E_x}{c} & 0 & -B_z & B_y \\ \frac{E_y}{c} & B_z & 0 & -B_x \\ \frac{E_z}{c} & -B_y & B_x & 0 \end{pmatrix}$$

★ ②. 电磁场的麦克斯韦方程:

$$\partial_\mu F^{\mu\nu} = \mu_0 J^\nu, \quad \nu = 0, 1, 2, 3. \Rightarrow \text{推导 (稍微看下)}$$

$$\begin{cases} \vec{\nabla} \times \vec{\nabla} \cdot \vec{E} = \frac{\rho}{\epsilon_0}, \quad \nu = 0 \\ \vec{\nabla} \times \vec{B} - \frac{1}{c^2} \frac{\partial \vec{E}}{\partial t} = \mu_0 \vec{J}, \quad \nu = 1, 2, 3 \end{cases}$$

③. 电磁场的洛伦兹变换.

$$F^{\mu\nu} \rightarrow F'^{\mu\nu} = \Lambda^\mu_\alpha \Lambda^\nu_\beta F^{\alpha\beta}$$

$$\begin{cases} \vec{E}' = \vec{E} \\ E'_y = \frac{E_y - B_z v}{\sqrt{1 - v^2/c^2}} \\ E'_z = \frac{E_z + B_y v}{\sqrt{1 - v^2/c^2}} \end{cases} \quad \begin{cases} B'_x = B_x \\ B'_y = \frac{B_y + \frac{E_z v}{c^2}}{\sqrt{1 - v^2/c^2}} \\ B'_z = \frac{B_z - \frac{E_y v}{c^2}}{\sqrt{1 - v^2/c^2}} \end{cases}$$

对比总结:

麦克斯韦方程组:

协变形式

$$\partial_\mu F^{\mu\nu} = \mu_0 j^\nu, \quad \nu = 0, 1, 2, 3$$

时空形式

$$\begin{cases} \vec{\nabla} \cdot \vec{E} = \frac{\rho}{\epsilon_0}, & \nu = 0 \\ \vec{\nabla} \times \vec{B} - \frac{1}{c} \frac{d\vec{E}}{dt} = \mu_0 \vec{j}, & \nu = 1, 2, 3 \end{cases}$$

电磁势的洛伦兹规范:

$$\partial_\mu A^\mu = 0$$

规范变换: $A^\mu \rightarrow A'^\mu = A^\mu - \partial^\mu \lambda$

达朗贝尔方程:

$$\square^2 A^\nu = \mu_0 j^\nu$$

电流连续性方程:

$$\partial_\mu j^\mu = 0$$

$$\frac{1}{c} \frac{\partial \Phi}{\partial t} + \vec{\nabla} \cdot \vec{A} = 0$$

$$\begin{cases} \Phi' = \Phi - \frac{\partial \lambda}{\partial t} \\ \vec{A}' = \vec{A} + \vec{\nabla} \lambda \end{cases}$$

$$\begin{cases} \frac{1}{c} \frac{\partial \Phi}{\partial t} - \vec{\nabla} \cdot \vec{A} = \rho / \epsilon_0 \\ \frac{1}{c} \frac{\partial \vec{A}}{\partial t} - \vec{\nabla} \Phi = \mu_0 \vec{j} \end{cases}$$

$$\frac{\partial \rho}{\partial t} + \vec{\nabla} \cdot \vec{j} = 0$$

三. 电动力学中的拉格朗日量和哈密顿量.

(1) 欧拉-拉格朗日方程: (由 $\delta A = \delta \int_{t_1}^{t_2} L(x_\mu, \eta_\mu) dt \Rightarrow$ 推得)

$$\frac{\partial L}{\partial x_\mu} - \frac{d}{dt} \left(\frac{\partial L}{\partial \eta_\mu} \right) = 0, \quad \mu = 0, 1, 2, 3 \quad \rightarrow \quad \text{理论力学中: } \frac{d}{dt} \left(\frac{\partial L}{\partial \dot{q}_\alpha} \right) - \frac{\partial L}{\partial q_\alpha} = 0$$

(2) 拉格朗日量: $L(x_\mu, \eta_\mu) = \frac{1}{2} m \eta_\mu \eta^\mu + q \eta_\mu A^\mu(x^\nu)$ (直接给出)

(3) 粒子 (m, q) 的协变运动方程. $\hookrightarrow$ 代入拉格朗日方程可解

$$\frac{dp^\nu}{d\tau} = q \eta_\mu F^{\nu\mu}$$

14. 协变哈密顿量:

①. 广义动量: $p^\mu = \frac{\partial L}{\partial \eta_\mu}$

哈密顿量: $H = p^\mu \eta_\mu - L = H(\underline{x}_\mu, p_\mu)$ ↗ 不变量

↓
将 p^μ 代入可得 $H = \frac{1}{2}mc^2$, 为洛伦兹不变量.

②. 由哈密顿正则方程可推协变运动方程

§5. 电磁场与粒子

一. 李维势 (掌握证明过程和公式)

引入瞬时惯性系: $\tilde{\Phi} = \frac{q}{4\pi\epsilon_0 r}$, $\tilde{\mathbf{A}} = 0$, $\tilde{r} = c(\tilde{t} - \tilde{t}')$

由洛伦兹变换: (相对于瞬时参考系)

$$\begin{cases} \tilde{\mathbf{A}} = \frac{\tilde{\mathbf{v}} \tilde{\Phi}}{c^2 \sqrt{1 - v^2/c^2}} = \frac{1}{\sqrt{1 - v^2/c^2}} \frac{q \tilde{\mathbf{v}}}{4\pi\epsilon_0 c^2 r} \\ \tilde{\Phi} = \frac{\Phi}{\sqrt{1 - v^2/c^2}} = \frac{1}{\sqrt{1 - v^2/c^2}} \frac{q}{4\pi\epsilon_0 r} \\ \tilde{r} = \frac{r - \frac{\mathbf{v}}{c} \cdot \mathbf{r}}{\sqrt{1 - v^2/c^2}} \end{cases} \Rightarrow$$

李维势:

$$\Phi(t, \mathbf{r}) = \frac{q}{4\pi\epsilon_0 (r - \mathbf{r} \cdot \mathbf{v}/c)}$$

$$\mathbf{A}(t, \mathbf{r}) = \frac{q \mathbf{v}}{4\pi\epsilon_0 c^2 (r - \mathbf{r} \cdot \mathbf{v}/c)}$$

这里 $\mathbf{r}$, $\mathbf{v}$ 都与时间有关.

二. 电偶极辐射 (推导看懂就行, 不要求掌握)

$$\begin{cases} \tilde{\mathbf{B}} = \nabla \times \tilde{\mathbf{A}} \\ \tilde{\mathbf{E}} = -\nabla \tilde{\Phi} - \frac{\partial \tilde{\mathbf{A}}}{\partial \tilde{t}} \end{cases}$$

$$\tilde{\mathbf{p}}(t') = q \tilde{\mathbf{x}}(t')$$

自场 (库仑场)

$$\tilde{\mathbf{E}}(t, \mathbf{r}) = \frac{1}{4\pi\epsilon_0} \frac{q \mathbf{r}}{r^3}$$

$$\tilde{\mathbf{B}}(t, \mathbf{r}) = \frac{1}{4\pi\epsilon_0 c^2} \frac{q \mathbf{v} \times \mathbf{r}}{r^3}$$

电偶极辐射

$$\tilde{\mathbf{E}}(t, \mathbf{r}) = \frac{q}{4\pi\epsilon_0 c^2 r} \tilde{\mathbf{e}}_r \times (\tilde{\mathbf{e}}_r \times \tilde{\mathbf{v}}) = \frac{1}{4\pi\epsilon_0 c^2 r} \ddot{\mathbf{p}} \times \hat{\mathbf{n}} \times \hat{\mathbf{n}}$$

$$\tilde{\mathbf{B}}(t, \mathbf{r}) = \frac{q}{4\pi\epsilon_0 c^2 r} \tilde{\mathbf{v}} \times \tilde{\mathbf{e}}_r = \frac{1}{4\pi\epsilon_0 c^2 r} \ddot{\mathbf{p}} \times \hat{\mathbf{n}} \Rightarrow \text{理解掌握即可}$$

差别在于下面是针对单色波的情况, 可以提出 $e^{i\omega t}$, 而上面的针对的是一个运动的粒子.

$$\begin{aligned} \tilde{\mathbf{E}}(t, \mathbf{r}) &= \frac{1}{4\pi\epsilon_0 c^2} \frac{e^{i(\mathbf{k} \cdot \mathbf{r} - \omega t)}}{R} \ddot{\mathbf{p}} \times \hat{\mathbf{n}} \times \hat{\mathbf{n}} \\ \tilde{\mathbf{B}}(t, \mathbf{r}) &= \frac{1}{4\pi\epsilon_0 c^2} \frac{e^{i(\mathbf{k} \cdot \mathbf{r} - \omega t)}}{R} \ddot{\mathbf{p}} \times \hat{\mathbf{n}} \end{aligned}$$

要求计算

($\tilde{\mathbf{E}}, \tilde{\mathbf{B}}$ 写成指数形式)

$$\tilde{\mathbf{S}}(t, \mathbf{r}) = \frac{q^2 \dot{\mathbf{v}}^2}{16\pi^2 \epsilon_0 c^3 r^2} \sin^2 \theta \hat{\mathbf{n}}$$

$$\frac{dP(t)}{d\Omega} = \frac{q^2 \dot{\mathbf{v}}^2}{16\pi^2 \epsilon_0 c^3} \sin^2 \theta$$

$$P(t) = \frac{q^2 \dot{\mathbf{v}}^2}{6\pi^2 \epsilon_0 c^3}$$

(理解掌握)

$$\langle \tilde{\mathbf{S}} \rangle = \frac{|\ddot{\mathbf{p}}|^2}{32\pi^2 \epsilon_0 c^3 R^2} \sin^2 \theta \hat{\mathbf{n}}$$

$$\begin{aligned} P &= \oint \langle \tilde{\mathbf{S}} \rangle R^2 d\Omega \\ &= \frac{|\ddot{\mathbf{p}}|^2}{32\pi^2 \epsilon_0 c^3} \oint \sin^2 \theta d\Omega \\ &= \frac{|\ddot{\mathbf{p}}|^2}{12\pi^2 \epsilon_0 c^3} \end{aligned}$$

Q. 这里是由电磁势推电磁场

三. 带电粒子的电磁场对粒子本身的反作用

! 不能用 $\vec{F} = q(\vec{E} + \vec{v} \times \vec{B})$ 计算, 因为 $r=0$, $\vec{E}, \vec{B} \rightarrow \infty$ 发散.

1.1 自场的反作用:

1. 经典电子模型:

"real" particle.

"nake" particle

将参照系选在粒子上: 分析某一瞬时: 静止.

$$\begin{aligned} \therefore \text{电磁场能量: } W &= \int w dV \\ &= \int \frac{1}{2} (\epsilon_0 E^2 + \frac{1}{\mu_0} B^2) dV \\ &= \frac{\epsilon_0}{2} \int_{r_e}^{\infty} \left(\frac{e}{4\pi\epsilon_0 r^2} \right)^2 4\pi r^2 dr \\ &= \frac{e^2}{8\pi\epsilon_0 r_e} \end{aligned}$$

裸粒子质量
→ 自场质量

而由 $E = m_{em} c^2 \Rightarrow$ 经典电磁质量: $m_{em} = \frac{e^2}{8\pi\epsilon_0 r_e c^2}$ (r_e 未知)

而实际电子质量: $m = m_0 + m_{em}$

不失一般性: $m_0 = m_{em}$ (裸粒子质量)

$$\therefore m = m_0 + m_{em} = \frac{e^2}{4\pi\epsilon_0 r_e c^2}$$

$$r_e = \frac{e^2}{4\pi\epsilon_0 m c^2} = 2.8179 \times 10^{-15} \text{ m} \approx 3 \text{ fm}$$

1.2 辐射场的反作用:

在加速运动的粒子周围做一大球面, 单位时间内通过球面的能量:

$$P = \frac{e^2 \dot{v}^2}{6\pi\epsilon_0 c^3}$$

现将: "粒子在加速运动中损失能量" $\Leftrightarrow$ "粒子在一有阻尼的空间中运动"

引入阻尼力: $\vec{F}_s \cdot \vec{v} = - \frac{e^2 \dot{v}^2}{6\pi\epsilon_0 c^3}$

现研究粒子的运动:

$$\begin{aligned} \int_{t_0}^{t_0+T} \vec{F}_s \cdot \vec{v} dt &= - \int_{t_0}^{t_0+T} \frac{e^2 \ddot{v}}{6\pi\epsilon_0 c^3} dt \\ &= - \int_{t_0}^{t_0+T} \frac{e^2}{6\pi\epsilon_0 c^3} \dot{v} \cdot \dot{v} dt = d\dot{v} \\ &= - \int_{t_0}^{t_0+T} \frac{e^2}{6\pi\epsilon_0 c^3} \dot{v} d\dot{v} \\ &= \left[-\frac{e^2}{12\pi\epsilon_0 c^3} \dot{v} \cdot \dot{v} \right]_{t_0}^{t_0+T} + \int_{t_0}^{t_0+T} \frac{e^2}{6\pi\epsilon_0 c^3} \ddot{v} \cdot \dot{v} dt \\ &= 0 + \int_{t_0}^{t_0+T} \frac{e^2}{6\pi\epsilon_0 c^3} \ddot{v} \cdot \dot{v} dt \end{aligned}$$

\$\dot{v}\$ 和 \$\ddot{v}\$ 具有周期性

$\therefore \vec{F}_s = \frac{e^2}{6\pi\epsilon_0 c^3} \ddot{v} \Rightarrow$ 与加速度成正比.

低速近似时: $v \ll c$ $\therefore \frac{d(m\vec{v})}{dt} = \vec{F}_e + \vec{F}_s$
↓
 用于维持加速运动

四. 谱线的自然宽度. (自己了解吧, 不考).

五. 带电粒子对外加电磁场的散射

(1) 自由电子在外加电磁场 (平面电磁波) 中运动

$\frac{d}{dt}(m\vec{v}) = \vec{F}_e + \vec{F}_s$, $\vec{F}_s = \frac{e^2}{6\pi\epsilon_0 c^3} \ddot{v}$, $\vec{E} = \vec{E}_0 e^{i(\vec{k} \cdot \vec{r} - \omega t)} = \vec{E}_0 e^{-i\omega t}$
\$\vec{v}, \vec{F}_e, \vec{F}_s\$ 都在同一线上
 $\therefore \ddot{x} - \frac{e^2}{6\pi\epsilon_0 c^3 m} \ddot{x} = \frac{e}{m} E_0 e^{-i\omega t}$ → 外加的周期力

$\therefore \ddot{x} + \gamma \dot{x} = \frac{e}{m} E_0 e^{-i\omega t}$, $\gamma = \frac{e^2 \omega^2}{6\pi\epsilon_0 m c^3}$

猜解: $x = x_0 e^{-i\omega t}$

代入解得: $x_0 = -\frac{e E_0}{m(\omega^2 + i\omega\gamma)}$ $\Rightarrow$ 当 $\gamma \ll \omega$ 时: $x = -\frac{e E_0}{m\omega^2} e^{-i\omega t}$

受迫简谐振动 振幅不变.

汤姆逊散射:

粒子加速运动产生的辐射场:

$\vec{E}(t, \vec{r}) = \frac{1}{4\pi\epsilon_0 r} \ddot{\vec{r}} \times \hat{n} \times \hat{n}$

$\vec{B}(t, \vec{r}) = \frac{1}{4\pi\epsilon_0 c^2 r} \ddot{\vec{r}} \times \hat{n}$

$\vec{v} = \dot{\vec{r}} \Rightarrow$

写成 E, B 的大小形式, 且忽略 $e^{-i\omega t}$

例: $E = \frac{e \ddot{x}}{4\pi\epsilon_0 c^2 r} \sin\alpha = \frac{e^2 E_0}{4\pi\epsilon_0 m c^2 r} \sin\alpha$

$B = \frac{e^2 E_0}{4\pi\epsilon_0 m c^2 r} \sin\alpha$

求平均时方向不重要, E 和 B 垂直不会引入 sin 0 求平均时会消掉

$$\therefore \langle S \rangle = \frac{1}{2\mu_0} \operatorname{Re} \{ \vec{E} \times \vec{B}^* \}$$

粒子吸收外加场的部分能量后产生的辐射场的平均能流密度.

$$= \frac{e^4 E_0^2}{32\pi^2 \epsilon_0 c^3 m^2 r^2} \sin^2 \alpha, \quad \text{代入经典电磁半径: } r_e = \frac{e^2}{4\pi\epsilon_0 mc^2}$$

$$= \left[\frac{\epsilon_0 c E_0^2}{2} \right] \frac{r_e^2}{r^2} \sin^2 \alpha$$

$$= \frac{r_e^2}{r^2} \sin^2 \alpha I_0 \rightarrow I_0 = \frac{\epsilon_0 c E_0^2}{2} = \frac{E_0^2}{2\mu_0 c}$$

光学中定义.

(外加电磁场的平均能流密度)

$$\therefore P = \oint \langle S \rangle r^2 d\Omega = \frac{8\pi}{3} r_e^2 I_0$$

关心某一方向的P: 描述自由带电粒与外加电磁场相互作用的概率

散射截面: $\sigma = \frac{P}{I_0} = \left[\frac{8\pi}{3} r_e^2 \right] \rightarrow \sigma$ 粒子散射光子概率

微分散射截面: $\frac{d\sigma}{d\Omega} = \frac{r_e^2}{2} (1 + \cos^2 \theta) \Rightarrow$ 在某-锥底面的相对散射功率

2) 束缚电子在外加电磁场中运动

受力分析: 阻尼力 + 外加电磁场施加的力 + 原子核的引力

$$\ddot{x} + \gamma \dot{x} + \omega_0^2 x = \frac{e}{m} E_0 e^{-i\omega t}, \quad \omega_0: \text{原子绕核转的频率}, \quad \omega: \text{外加电磁波的频率}$$

$$\Rightarrow x = x_0 e^{-i\omega t}$$

$$= \frac{e}{m} \frac{1}{\sqrt{(\omega_0^2 - \omega^2)^2 + \omega^2 \gamma^2}} E_0 e^{-i(\omega t - \delta)}$$

瑞利散射:

由 $\vec{E} = \frac{e\ddot{x}}{4\pi\epsilon_0 c^2 r} \sin\alpha$, $\vec{B} = \frac{e\dot{x}}{4\pi\epsilon_0 c^2 r} \sin\alpha$ 得:

$$\langle S \rangle = \frac{e^4 E_0^2}{32\pi^2 \epsilon_0 c^3 m^2 r^2} \frac{\omega^4}{(\omega_0^2 - \omega^2)^2 + \omega^2 \gamma^2} \sin^2 \alpha \quad \leftarrow \langle S \rangle = \frac{1}{2\mu_0} \operatorname{Re} \{ \vec{E} \times \vec{B}^* \} \text{ 可推.}$$

$$P = \oint \langle S \rangle ds = \frac{8\pi}{3} r_e^2 \frac{\omega^4}{(\omega_0^2 - \omega^2)^2 + \omega^2 \gamma^2} I_0$$

$$\sigma = \frac{P}{I_0} = \frac{8\pi}{3} r_e^2 \frac{\omega^4}{(\omega_0^2 - \omega^2)^2 + \omega^2 \gamma^2}$$

①. $\omega \ll \omega_0$ (大部分情况): $\sigma = \frac{8\pi}{3} r_e^2 \left(\frac{\omega}{\omega_0} \right)^4 \rightarrow$ 瑞利散射

②. $\omega \gg \omega_0$: $\sigma = \frac{8\pi}{3} r_e^2 \rightarrow$ 汤姆逊散射

③. $\omega = \omega_0$ (共振): $\sigma = \frac{8\pi}{3} r_e^2 \left(\frac{\omega}{\gamma} \right)^2 \rightarrow$ 共振

↓
见后

电子的吸收与共振:

$$P = \frac{8\pi}{3} r_e^2 \frac{\omega^4}{(\omega_0^2 - \omega^2)^2 + \omega^2 \gamma^2} I_0$$

$$W = \frac{8\pi}{3} r_e^2 \int_0^\infty \frac{\omega^4 I_0(\omega)}{(\omega_0^2 - \omega^2)^2 + \omega^2 \gamma^2} d\omega, \quad \int_0^\infty \frac{\omega^4}{(\omega_0^2 - \omega^2)^2 + \omega^2 \gamma^2} d\omega \approx \frac{\pi \omega_0^4}{2\gamma}$$

$$\therefore W = 2\pi^2 r_e^2 c I_0(\omega)$$

$$\sigma = \frac{8\pi}{3} r_e^2 \left(\frac{\omega}{\gamma}\right)^2$$

§6. 物质当中的电磁场

一. 宏观的麦克斯韦方程.

(1). 极化强度矢量.

$$\vec{P} = \frac{\sum \vec{p}_i}{\Delta V}, \quad \vec{p} = q\vec{r}$$

$$\textcircled{1}. \int_V \rho_p dV = - \oint_S \vec{P} \cdot d\vec{s}$$

$$\Rightarrow \text{体极化电荷密度: } \rho_p = -\vec{\nabla} \cdot \vec{P}$$

$$\textcircled{2}. \oint_S \vec{P} \cdot d\vec{s} = -(\vec{P}_2 - \vec{P}_1) \cdot d\vec{s}$$

$$\Rightarrow \text{面极化电荷密度: } \sigma_p = -\hat{n} \cdot (\vec{P}_2 - \vec{P}_1)$$

$$\text{当 } \vec{P}_2 = 0 \text{ 时, } \sigma_p = \hat{n} \cdot \vec{P}$$

由麦克斯韦方程: $\vec{\nabla} \cdot \vec{E} = \rho_f + \rho_p$ (所有电荷)

$$\text{又: } \rho_p = -\vec{\nabla} \cdot \vec{P}$$

$$\therefore \vec{\nabla} \cdot (\epsilon_0 \vec{E} + \vec{P}) = \rho_f$$

$$\text{定义: 电位移矢量: } \vec{D} = \epsilon_0 \vec{E} + \vec{P}$$

$$\therefore \text{上式改写为: } \vec{\nabla} \cdot \vec{D} = \rho_f$$

实验得: 对于一般各向同性线性介质.

$$\vec{P} = \chi_e \epsilon_0 \vec{E}, \quad \chi_e: \text{极化率} \propto \frac{1}{T}$$

$$\therefore \vec{D} = \epsilon \vec{E}$$

$$= \epsilon_f \epsilon_0 \vec{E}$$

$$= (1 + \chi_e) \epsilon_0 \vec{E}$$

$$\text{真空中 } \chi_e = 0, \quad \epsilon = \epsilon_0$$

(2). 磁化强度矢量.

$$\vec{M} = \frac{\sum \vec{m}_i}{\Delta V}, \quad \vec{m} = i\vec{a}$$

$$I_m = \oint_L n i \vec{a} \cdot d\vec{l} = \oint_L n \vec{m} \cdot d\vec{l} = \oint_L \vec{M} \cdot d\vec{l}$$

$$\therefore \oint_S \vec{j}_m \cdot d\vec{s} = \oint_L \vec{M} \cdot d\vec{l}$$

$$\textcircled{1} \Rightarrow \text{磁化电流密度: } \vec{j}_m = \vec{\nabla} \times \vec{M}$$

↳ 单位时间穿过单位面积的磁化电流

$$\textcircled{2} \text{ 磁化线电流密度: } \vec{\alpha}_m = \hat{n} \times (\vec{M}_2 - \vec{M}_1)$$

$$\text{当 } \vec{M}_2 = 0 \text{ 时, } \vec{\alpha}_m = \vec{M} \times \hat{n}$$

当外部电场变化时, 产生极化电流: $\vec{j}_p$

$$\vec{P} = \frac{\sum e \vec{x}_i}{\Delta V}$$

$$\frac{\partial \vec{P}}{\partial t} = \frac{\sum e \dot{\vec{x}}_i}{\Delta V} = \vec{j}_p$$

$$\therefore \text{总诱导电流密度: } \vec{j}_m + \vec{j}_p$$

由麦克斯韦方程:

$$\vec{\nabla} \times \vec{B} = \vec{j}_f + \vec{j}_m + \vec{j}_p + \epsilon_0 \frac{\partial \vec{E}}{\partial t}$$

又: $\vec{j}_m = \vec{\nabla} \times \vec{M}$ 代入得: $\vec{j}_p = \frac{\partial \vec{P}}{\partial t}$ 所有电流

$$\vec{\nabla} \times (\frac{\vec{B}}{\mu_0} - \vec{M}) = \vec{j}_f + \frac{\partial (\epsilon_0 \vec{E} + \vec{P})}{\partial t}$$

$$\text{定义: 磁场强度: } \vec{H} = \frac{\vec{B}}{\mu_0} - \vec{M}$$

$$\therefore \text{上式改写为: } \vec{\nabla} \times \vec{H} = \vec{j}_f + \frac{\partial \vec{D}}{\partial t}$$

实验得: 对于各向同性非铁磁质:

$$\vec{M} = \chi_m \vec{H}, \quad \chi_m: \text{磁化率} \propto \frac{1}{T}$$

$$\therefore \vec{B} = \mu \vec{H}$$

$$= \mu_r \mu_0 \vec{H}$$

$$= (1 + \chi_m) \mu_0 \vec{H}$$

$$\text{非磁性物质: } \chi_m \rightarrow 0, \quad \therefore \mu = \mu_0$$

物质中的麦克斯韦方程组

$$\begin{cases} \vec{\nabla} \cdot \vec{D} = \rho_f \\ \vec{\nabla} \times \vec{E} = -\frac{\partial \vec{B}}{\partial t} \\ \vec{\nabla} \cdot \vec{B} = 0 \\ \vec{\nabla} \times \vec{H} = \vec{j}_f + \frac{\partial \vec{D}}{\partial t} \end{cases}$$

本构关系:

$$\begin{cases} \vec{D} = \epsilon \vec{E} \\ \vec{B} = \mu \vec{H} \end{cases}$$

→ 适用于: 一定温度范围内的线性材料.

欧姆定律:

$$\vec{j} = \sigma \vec{E}$$

→ 导体适用

二. 边界条件.

11. 积分形式: → 可在不连续介质中应用

$$\oint_S \vec{D} \cdot d\vec{S} = Q_f$$

通过闭合曲面内的总自由电荷

$$\oint_L \vec{E} \cdot d\vec{l} = -\frac{d}{dt} \int_S \vec{B} \cdot d\vec{S}$$

$$\oint_S \vec{B} \cdot d\vec{S} = 0$$

$$\oint_L \vec{H} \cdot d\vec{l} = I_f + \frac{d}{dt} \int_S \vec{D} \cdot d\vec{S}$$

通过曲面S的总电流
自由

12. 全用 $\vec{D}$, $\vec{H}$ 表示:

$$\vec{\nabla} \cdot \vec{D} = \rho_f$$

$$\vec{\nabla} \times \vec{D} = -\mu \epsilon \frac{\partial \vec{H}}{\partial t}$$

$$\vec{\nabla} \cdot \vec{H} = 0$$

$$\vec{\nabla} \times \vec{H} = \vec{j}_f + \frac{\partial \vec{D}}{\partial t}$$

13. 由 $\oint_S \vec{D} \cdot d\vec{S} = Q_f \Rightarrow \vec{D}_1 \cdot \vec{a}_1 + \vec{D}_2 \cdot \vec{a}_2 = \sigma_f a$

$$\therefore \begin{cases} D_1^\perp - D_2^\perp = \sigma_f & \rightarrow \text{有} \sigma_f \text{ 时, 电位移矢量法向不连续; 无} \sigma_f \text{ 时连续} \\ \epsilon_1 E_1^\perp - \epsilon_2 E_2^\perp = \sigma_f & \rightarrow \text{无论有无} \sigma_f, \text{ 电场强度法向都不连续} \end{cases}$$

同理, 由 $\oint_S \vec{B} \cdot d\vec{S} = 0$

$$\Rightarrow B_1^\perp - B_2^\perp = 0 \rightarrow \text{磁感应强度法向连续}$$

面电荷分布使界面两侧电场法向分量发生跃变.

$$(4) \text{ 由 } \oint_L \vec{H} \cdot d\vec{l} = I_f + \frac{d}{dt} \int_S \vec{B} \cdot d\vec{S}$$

$$\therefore \vec{H}_2 \cdot \vec{l} - \vec{H}_1 \cdot \vec{l} = 0 \quad I_f$$

$$I_f = (\hat{n} \times \vec{l}) \cdot \vec{k}_f = (\vec{k}_f \times \hat{n}) \cdot \vec{l}$$

$$\therefore H_2 - H_1 = \vec{k}_f \times \hat{n}$$

$$\therefore \hat{n} \times (\vec{H}_2 - \vec{H}_1) = \vec{k}_f \rightarrow \text{磁场强度矢量切向不连续}$$

$$\text{同理: } \oint_L \vec{E} \cdot d\vec{l} = -\frac{d}{dt} \int_S \vec{B} \cdot d\vec{S}$$

$$\vec{E}_2 - \vec{E}_1 = 0$$

$$\therefore \hat{n} \times (\vec{E}_2 - \vec{E}_1) = 0 \rightarrow \text{电场强度矢量切向连续}$$

反而使方向变了, 感觉多此一举.

画图时:

物理原因: 静电场是保守场, 沿闭合路径做功为0, 若切向电场突变, 会导致路径积分非零, 违反能量守恒.

$\therefore$ 电磁场的边界条件: (一般情况)

$$\hat{n} \cdot (\vec{D}_2 - \vec{D}_1) = \sigma_f \quad \dots \text{①}$$

$$\hat{n} \times (\vec{E}_2 - \vec{E}_1) = 0 \quad \dots \text{②} \quad \text{其中: } \hat{n} \text{ 为介质1指向介质2}$$

$$\hat{n} \cdot (\vec{B}_2 - \vec{B}_1) = 0 \quad \dots \text{③}$$

$$\hat{n} \times (\vec{H}_2 - \vec{H}_1) = \vec{k}_f \quad \dots \text{④}$$

$$\sigma_p = -\hat{n} \cdot (\vec{p}_2 - \vec{p}_1)$$

$$\vec{\alpha}_m = \hat{n} \times (\vec{M}_2 - \vec{M}_1)$$

①. 当介质2为真空.

$$\text{①} \sim \text{④} \text{ 不变, } \sigma_p = \hat{n} \cdot \vec{p} \quad (\vec{p}_2 = 0)$$

$$\vec{\alpha}_m = \vec{M} \times \hat{n} \quad (\vec{M}_2 = 0)$$

不是顺磁介质, 无法被磁化, 极化.

②. 界面处无自由电荷、电流时.

$$\hat{n} \cdot (\vec{D}_2 - \vec{D}_1) = 0$$

$$\hat{n} \times (\vec{E}_2 - \vec{E}_1) = 0$$

$$\hat{n} \cdot (\vec{B}_2 - \vec{B}_1) = 0$$

$$\hat{n} \times (\vec{H}_2 - \vec{H}_1) = 0$$

③. 当介质1为一般导体时:

$$\hat{n} \cdot \vec{D} = \sigma \rightarrow \text{给定的、感应的}$$

$$\hat{n} \times \vec{E} = 0 \Rightarrow \text{说明导体表面 } \vec{E} \text{ 垂直}$$

$$\hat{n} \cdot \vec{B} = 0$$

$$\hat{n} \times \vec{H} = 0 \quad \vec{k}_f \rightarrow$$

($\vec{D}_1, \vec{E}_1, \vec{B}_1, \vec{H}_1$ 均为0)

15) 电势的边界条件: (静电场中)

$$\vec{E} = -\vec{\nabla}\Phi$$

$$\hat{n} \times (\vec{E}_2 - \vec{E}_1) = 0$$

$$\hat{n} \cdot (\vec{D}_2 - \vec{D}_1) = \sigma$$

由 $d\Phi = -\vec{E} \cdot d\vec{l}$ 得: $\Phi_1 = \Phi_2$

$P_1 \rightarrow P_2$ 距离太短, 且 $\vec{E}$ 有限.
故 $\Phi_1 = \Phi_2$

即界面两侧的电势必须连续. (因为电势是标量场, 其连续性保证了能量和电场的有限性)

$$\hat{n} \times (\vec{E}_2 - \vec{E}_1) = 0 \Rightarrow \Phi_1' - \Phi_1 = \Phi_2' - \Phi_2 \quad (A2)$$

可验证: $\vec{E}$ 切向连续
 $\vec{E}_1 \cdot d\vec{l} = \vec{E}_2 \cdot d\vec{l}$
比较的是两个平行路径, 且等长, 这时两个电势差相等.

$$\begin{cases} \hat{n} \cdot (\vec{D}_2 - \vec{D}_1) = \sigma \\ \vec{E} = -\vec{\nabla}\Phi \end{cases} \Rightarrow \epsilon_2 \frac{\partial \Phi_2}{\partial n} - \epsilon_1 \frac{\partial \Phi_1}{\partial n} = -\sigma \rightarrow \epsilon_2 \vec{E}_2^\perp - \epsilon_1 \vec{E}_1^\perp = -\sigma$$

电场的法向分量
界面两侧电势的法向导数与介质介电常数、自由电荷直接相关.

当介质1为导体时, 由于 $\Phi = \text{const}$, $\frac{\partial \Phi}{\partial n} = 0$. 若导体周围为单层介质, 上述公式可简化为:

$$\epsilon \frac{\partial \Phi}{\partial n} = -\sigma$$

总结:

一般情况: $\Phi_1 = \Phi_2$

$$\epsilon_2 \frac{\partial \Phi_2}{\partial n} - \epsilon_1 \frac{\partial \Phi_1}{\partial n} = -\sigma$$

介质1为导体时:

$$\Phi = \text{const}$$

$$\epsilon \frac{\partial \Phi}{\partial n} = -\sigma$$

三. 物质中电磁波的传播

1) 当 $\rho_f = 0$, $\vec{j} = 0$ 时:

$$\begin{cases} \vec{\nabla} \cdot \vec{D} = 0 & \dots \textcircled{1} \\ \vec{\nabla} \times \vec{E} = -\frac{\partial \vec{B}}{\partial t} & \dots \textcircled{2} \\ \vec{\nabla} \cdot \vec{B} = 0 & \dots \textcircled{3} \\ \vec{\nabla} \times \vec{H} = \frac{\partial \vec{D}}{\partial t} & \dots \textcircled{4} \end{cases}$$

将 $\vec{D} = \epsilon_0 \vec{E}$, $\vec{B} = \mu_0 \vec{H}$ 代入得:
(真空)

真空中电磁波波动方程:

$$\begin{cases} \vec{\nabla}^2 \vec{E} - \mu_0 \epsilon_0 \frac{\partial^2 \vec{E}}{\partial t^2} = 0 \\ \vec{\nabla}^2 \vec{B} - \mu_0 \epsilon_0 \frac{\partial^2 \vec{B}}{\partial t^2} = 0 \end{cases}$$

下面研究介质中的波动方程 $\Rightarrow$ 依然认为介质内无源, 且为自由空间(无边界)

法一. 将 $\vec{D} = \epsilon \vec{E}$, $\vec{B} = \mu \vec{H}$ 代入, 可得类似结果.

法二. 假设该电磁场为时谐电磁场: $\vec{E}(\vec{r}, t) = \vec{E}(\vec{r}) e^{i\omega t}$
 $\vec{B}(\vec{r}, t) = \vec{B}(\vec{r}) e^{-i\omega t}$

由③ $\Rightarrow \nabla \times \vec{E} = i\omega \vec{B}(\vec{r}, t) = i\omega \mu \vec{H}$

由④ $\Rightarrow \nabla \times \vec{H} = -i\omega \epsilon \vec{E}$

横波条件 $\left\{ \begin{array}{l} \vec{\nabla} \cdot \vec{E} = 0 \\ \vec{\nabla} \cdot \vec{H} = 0 \end{array} \right.$

$\nabla \times (\nabla \times \vec{E}) = i\omega \mu \nabla \times \vec{H}$

$\Rightarrow \left\{ \begin{array}{l} \nabla (\nabla \cdot \vec{E}) - \nabla^2 \vec{E} = i\omega \mu (-i\omega \epsilon \vec{E}) \\ \nabla^2 \vec{E} + \omega^2 \mu \epsilon \vec{E} = 0 \end{array} \right.$

令 $k = \omega \sqrt{\mu \epsilon}$. $\therefore$ 亥姆霍兹方程: $\nabla^2 \vec{E} + k^2 \vec{E} = 0$

若 $v = \frac{1}{\sqrt{\mu \epsilon}}$, $|k| = \frac{\omega}{v}$.

平面波解: $\vec{E}(t, \vec{r}) = \vec{E}(\vec{r}) e^{i\omega t} = \vec{E}_0 e^{i(\vec{k} \cdot \vec{r} - \omega t)}$

$\Rightarrow$ 平均能量密度: $\langle w \rangle = \frac{1}{4} \text{Re} \{ \epsilon \vec{E} \cdot \vec{E}^* + \frac{1}{\mu} \vec{B} \cdot \vec{B}^* \}$
 $= \frac{1}{2} \epsilon E_0^2 = \frac{1}{2\mu} B_0^2$

平均能流密度矢量: $\langle \vec{S} \rangle = \frac{1}{2} (\vec{E}^* \times \vec{H}) = \frac{1}{2} \sqrt{\frac{\epsilon}{\mu}} E_0^2 \hat{n}$

12) 电磁波在金属导体中传播 (了解)

平面波解: 设 $\vec{k} = \vec{\beta} + i\vec{\alpha}$

$\vec{E}(t, \vec{r}) = \vec{E}_0 e^{i(\vec{k} \cdot \vec{r} - \omega t)} = \boxed{\vec{E}_0 e^{-\vec{\alpha} \cdot \vec{r}}} e^{i(\vec{\beta} \cdot \vec{r} - \omega t)}$

说明电磁波无法在金属中深入传播: 趋肤效应

对于良导体: $\alpha \approx \beta \approx \sqrt{\frac{\omega \mu \sigma}{2}}$

$\therefore \vec{E}(t, \vec{r}) = \vec{E}_0 e^{-\vec{\alpha} \cdot \vec{r}} e^{i(\vec{\beta} \cdot \vec{r} - \omega t)}$

$\delta = \frac{1}{\alpha} = \sqrt{\frac{2}{\omega \mu \sigma}} \Rightarrow$ 波幅降至原值的 $\frac{1}{e}$ 的传播距离称为穿透深度 δ

W1. 电磁场以及和它相互作用的高频电流仅集中在表面很薄一层内 / 这种现象称为趋肤效应

描述了电磁波在导体中的穿透能力, 反映了导体的电磁屏蔽效应

§7 边界问题.

泊松方程: $\nabla^2 \Phi = -\frac{\rho}{\epsilon}$

拉普拉斯方程: $\nabla^2 \Phi = 0$

一、静电学中的唯一性定理

(1) 第一唯一性定理:

“若边界的电势 Φ 是一确定的函数, 则边界内部区域拉普拉斯方程的解唯一确定, 即内部 Φ 的分布唯一确定”

证明: “反证法”

假设边界内电势同时满足 $\nabla^2 \Phi_1 = 0$, $\nabla^2 \Phi_2 = 0$, 且 $\Phi_1|_{\Sigma} = \Phi_2|_{\Sigma} = \Phi_0(x, y, z)$

令 $\Phi_3 = \Phi_1 - \Phi_2$

$\therefore \nabla^2 \Phi_3 = \nabla^2 \Phi_1 - \nabla^2 \Phi_2 = 0$

且 $\Phi_3|_{\Sigma} = \Phi_1|_{\Sigma} - \Phi_2|_{\Sigma} = 0$

由 Laplace 解的特点: 在给定的区域内无取值, 有也只能存在于边界上.

$\therefore \Phi_3 = 0$

$\therefore \Phi_1 - \Phi_2 = 0$ 即 $\Phi_1 = \Phi_2$

$\therefore$ 边界内部区域 Φ 的分布唯一确定.

(2) 第二唯一性定理:

“在一个^{自由}电荷密度 ρ 给定且包含导体的区域内, 若每个导体上的总电荷量已知, 则该区域内电场 $\vec{E}$ 的分布唯一确定” (大前提: 边界上的 Φ 唯一确定)

证明: 假设区域内都满足: $\nabla \cdot \vec{E} = \frac{\rho}{\epsilon}$, $\nabla \cdot \vec{E}_1 = \frac{\rho}{\epsilon}$

在第 i 个导体上, 由高斯定律: $\oint_{\Sigma_i} \vec{E} \cdot d\vec{s} = \frac{Q_i}{\epsilon}$

$\oint_{\Sigma_i} \vec{E}_1 \cdot d\vec{s} = \frac{Q_i}{\epsilon}$

在最外围边界上, 由高斯定律: $\oint_{\Sigma} \vec{E} \cdot d\vec{s} = \frac{Q_{total}}{\epsilon}$

$\oint_{\Sigma} \vec{E}_1 \cdot d\vec{s} = \frac{Q_{total}}{\epsilon}$

令 $\vec{E}_3 = \vec{E} - \vec{E}_1$

$\therefore \nabla \cdot \vec{E}_3 = \nabla \cdot \vec{E} - \nabla \cdot \vec{E}_1 = 0 \Rightarrow \oint_{\Sigma} \vec{E}_3 \cdot d\vec{s} = 0 \dots \textcircled{1}$

令 $\vec{E}_3 = -\nabla \Phi_3$, $\vec{E}_1 = -\nabla \Phi_1$, $\vec{E}_1 = -\nabla \Phi_1$, 令 $\Phi_3 = \Phi_1 - \Phi_2$

$\therefore \nabla \cdot (\Phi_3 \vec{E}_3) = \nabla \Phi_3 \cdot \vec{E}_3 + \Phi_3 \nabla \cdot \vec{E}_3 = \nabla \Phi_3 \cdot \vec{E}_3 = -E_3^2$

对上式两边做体积分:

$$\int_V \vec{\nabla} \cdot (\vec{\Phi} \vec{E}_3) dV = - \int_V \vec{E}_3 dV$$

$$\text{等号左边} = \sum_m \oint_{S_m} \vec{\Phi}_3 \vec{E}_3 \cdot d\vec{S}$$

$$= \oint_S \vec{\Phi}_3 \vec{E}_3 \cdot d\vec{S} + \sum_i \oint_{S_i} \vec{\Phi}_3 \vec{E}_3 \cdot d\vec{S}$$

对于导体表面, $\vec{\Phi}_3$ 为常数. $\therefore \sum_i \oint_{S_i} \vec{\Phi}_3 \vec{E}_3 \cdot d\vec{S} = \sum_i \vec{\Phi}_3 \oint_{S_i} \vec{E}_3 \cdot d\vec{S} \stackrel{①}{=} 0$

对于外边界: $\vec{\Phi}_3 = \vec{\Phi}_1 - \vec{\Phi}_2$. 在边界上 $\vec{E}_1 = \vec{E}_2 = \vec{E}$. $\therefore \vec{E}_3 = 0 \quad \therefore \oint_S \vec{\Phi}_3 \vec{E}_3 \cdot d\vec{S} = 0$

$$\therefore \int_V \vec{\nabla} \cdot (\vec{\Phi}_3 \vec{E}_3) dV = 0$$

$$\therefore - \int_V \vec{E}_3 dV = 0 \Rightarrow \vec{E}_3 = 0$$

$$\therefore \vec{E}_1 = \vec{E}_2$$

$\therefore$ 边界内电场 $\vec{E}$ 的分布唯一确定.

二. 球坐标下分离变量

静电学的基本问题: 求满足给定边界条件的泊松方程的解.

许多问题中, 静电场是由带电导体决定的. 这些问题的特点是自由电荷只出现在一些导体的表面, 在空间中没有其它自由电荷分布. 因此, 若选择这些导体表面作为区域 V 的边界, 则在 V 内部 $\rho = 0$, 泊松方程化为拉普拉斯方程.

$$\vec{\nabla}^2 \phi = 0$$

产生此电场的电荷都分布于区域 V 的边界上, 它们的作用通过边界条件反映出来. 因此, 这类问题的解法是求拉普拉斯方程的满足边界条件的解.

1. 要解的方程: $\vec{\nabla}^2 \phi = 0 \quad \dots ①$

其中: $\vec{\Phi}(r, \theta, \varphi)$. 作业与考试中都有轴对称, 因此 $\vec{\Phi}$ 与 φ 无关 $\Rightarrow \vec{\Phi}(r, \theta)$

分离变量: $\vec{\Phi}(r, \theta) = R(r) \Theta(\theta)$

$$\text{球坐标系下: } \vec{\nabla}^2 \vec{\Phi} = \frac{1}{r} \frac{\partial}{\partial r} \left(r^2 \frac{\partial \vec{\Phi}}{\partial r} \right) + \frac{1}{r^2 \sin \theta} \frac{\partial}{\partial \theta} \left(\sin \theta \frac{\partial \vec{\Phi}}{\partial \theta} \right)$$

$$\nabla^2 \Phi = \frac{1}{r^2} \frac{d}{dr} \left(r^2 \frac{dR}{dr} \right) + \frac{1}{r^2 \sin \theta} \frac{d}{d\theta} \left(\sin \theta \frac{d\Theta}{d\theta} \right) = 0$$

等式两边同除: $R\Theta$

$$\therefore \frac{1}{Rr^2} \frac{d}{dr} \left(r^2 \frac{dR}{dr} \right) + \frac{1}{\Theta r^2 \sin \theta} \frac{d}{d\theta} \left(\sin \theta \frac{d\Theta}{d\theta} \right) = 0$$

$$\therefore \underbrace{\frac{1}{R} \frac{d}{dr} \left(r^2 \frac{dR}{dr} \right)}_{\lambda} + \underbrace{\frac{1}{\Theta \sin \theta} \frac{d}{d\theta} \left(\sin \theta \frac{d\Theta}{d\theta} \right)}_{-\lambda} = 0 \Rightarrow \text{由于 } \lambda \text{ 和 } \theta \text{ 可独立变化, 故两项都为常数.}$$

引入本征值 λ (0, 2, 6, 12, 20, ...) 则 λ 可以写为 $\lambda(\lambda+1)$, $\lambda=0, 1, 2, \dots$ 的形式

$\therefore$ 可得欧拉方程

$$\frac{d}{dr} \left(r^2 \frac{dR}{dr} \right) - \lambda(\lambda+1)R = 0 \quad \dots \textcircled{1}$$

$$\lambda = 0, 1, 2, \dots$$

$$\frac{d}{d\theta} \left(\sin \theta \frac{d\Theta}{d\theta} \right) + \lambda(\lambda+1) \sin \theta \Theta = 0 \quad \dots \textcircled{2}$$

解得:

$$\left. \begin{aligned} R(r) &= a_\lambda r^\lambda + \frac{b_\lambda}{r^{\lambda+1}} \\ \Theta(\theta) &= P_\lambda(\cos \theta) \end{aligned} \right\} \Rightarrow \text{通解: } \Phi(r, \theta) = \sum_{\lambda=0}^{\infty} \left(a_\lambda r^\lambda + \frac{b_\lambda}{r^{\lambda+1}} \right) P_\lambda(\cos \theta)$$

边界条件:

$$\textcircled{1}. r=R_0 \text{ 时, } \Phi_i = \Phi_e$$

$$\textcircled{2}. r=R_0 \text{ 时, } \epsilon_1 \frac{\partial \Phi_i}{\partial r} - \epsilon_2 \frac{\partial \Phi_e}{\partial r} = \sigma_f \quad (\text{求导之后代入 } r=R_0 \text{ 提边界条件})$$

$$\textcircled{3}. r \rightarrow 0 \text{ 时, } \Phi_i \rightarrow \infty \quad (\text{球内自然边界条件})$$

$$\textcircled{4}. r \rightarrow \infty \text{ 时, } \begin{cases} \Phi_i \rightarrow 0 & : \text{无外加电场, 仅靠球内电荷对无穷远的电势无影响, 电势为0} \\ \Phi_i \rightarrow -E_0 r \cos \theta & : \text{外加电场, 零电势点取球心.} \end{cases}$$

* ③④先代入可以化简通解简化运算.

$$\text{注: } P_0(\cos \theta) = 1$$

$$P_1(\cos \theta) = \cos \theta$$

$$P_2(\cos \theta) = \frac{1}{2}(3\cos^2 \theta - 1)$$

三. 镜像法.

上一种方法适用于所考虑的区域没有自由电荷分布的情况. 若求解电场的区域内有自由电荷, 则需解泊松方程. 其中一种重要情形是区域内只有1个或几个点电荷, 区域的边界是导体或介质界面. 即可用镜像法.

核心: 在导体内部找一个或几个假想电荷替代导体来产生相同的效果.

关键: 是否能满足边界条件.

步骤: (1) 建系, 找到镜像电荷且满足边界条件.

(2) 利用几个点电荷产生的电势叠加来求空间内电势分布. (记得规定范围)

(3) 利用第二类边界条件求解金属板上的感应电荷.

选做

$$\sigma = -\epsilon \frac{\partial \varphi}{\partial n} \Big|_z$$

(4) 求系统的总电磁能: 对于离散点电荷系:

$$U = \frac{1}{2} \sum_{i=1}^N \sum_{j=1}^N \frac{1}{4\pi\epsilon_0} \frac{q_i q_j}{r_{ij}}$$

r_{ij} 与 q_j 的距离

四. 边值关系与边界条件总结:

(1) 两绝缘介质界面上, 边值关系为:

$$\varphi_1 = \varphi_2, \quad \epsilon_1 \frac{\partial \varphi_1}{\partial n} = \epsilon_2 \frac{\partial \varphi_2}{\partial n}$$

(2) 给出导体上的电势, 导体面上的边界条件:

$$\varphi = \varphi_0 \text{ (常量)}$$

(3) 给出导体所带总电荷 Q , 在导体面上的边界条件:

$$\varphi = \text{const (待定)}$$

$$-\oint \epsilon \frac{\partial \varphi}{\partial n} ds = Q.$$

用上述条件可唯一解出静电场. 之后可以用:

$$-\epsilon \frac{\partial \varphi}{\partial n} = \sigma$$

得出导体面上的自由电荷密度 σ .

要背或要推导的公式

* 11) 速度: $\theta = \frac{1}{2} \ln \frac{1+\beta}{1-\beta}$, $\beta = \frac{v}{c}$, $\beta = \tanh \theta$

12) 要使间隔不变, 则: $g_{\mu\nu} \Lambda^\mu_\alpha \Lambda^\nu_\beta = g_{\alpha\beta}$, $\det \Lambda = 1$

13) 洛伦兹变换矩阵: (沿x轴有个速度v)

$$\Lambda^\mu_\nu = \begin{pmatrix} \gamma & -\gamma\beta & 0 & 0 \\ -\gamma\beta & \gamma & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} = \begin{pmatrix} \cosh\theta & -\sinh\theta & 0 & 0 \\ -\sinh\theta & \cosh\theta & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

14)

4-d 无穷小位移: $dx^\mu = (cdt, d\vec{x})$

~ 固有时间隔: $d\tau = \frac{1}{\gamma_u} dt$

4-d 速度矢量: $\eta^\mu = \frac{dx^\mu}{d\tau} = (\gamma_u c, \gamma_u \vec{u}) \rightarrow \eta_\mu \eta^\mu = c^2$

4-d 动量: $p^\mu = m\eta^\mu = \left(\frac{mc}{\sqrt{1-\frac{u^2}{c^2}}}, \frac{m\vec{u}}{\sqrt{1-\frac{u^2}{c^2}}} \right) = \left(\frac{E}{c}, \vec{p} \right) \rightarrow$ 爱因斯坦质壳关系: $E^2 = p^2 c^2 + m^2 c^4$

4-d 电流矢量: $j^\mu = (\rho c, \vec{j}) \rightarrow$ 电流连续性方程: $\partial_\mu j^\mu = 0$

4-d 电磁势: $A^\mu = \left(\frac{\Phi}{c}, \vec{A} \right) \rightarrow$ 洛伦兹规范: $\partial_\mu A^\mu = 0 \rightarrow \frac{1}{c} \frac{\partial \Phi}{\partial t} + \vec{\nabla} \cdot \vec{A} = 0$

$\rightarrow$ 规范变换: $A^\mu = A^\mu - \partial^\mu \lambda$ $\begin{cases} \Phi' = \Phi - \frac{\partial \lambda}{\partial t} \\ \vec{A}' = \vec{A} + \vec{\nabla} \lambda \end{cases}$

$\rightarrow$ 达朗贝尔方程: $\square^2 A^\nu = \mu_0 j^\nu$ $\begin{cases} \frac{1}{c^2} \frac{\partial^2 \Phi}{\partial t^2} - \vec{\nabla}^2 \Phi = \frac{\rho}{\epsilon_0} \\ \frac{1}{c^2} \frac{\partial^2 \vec{A}}{\partial t^2} - \vec{\nabla}^2 \vec{A} = \mu_0 \vec{j} \end{cases}$ ($\nu=0, 1, 2, 3$)

* 4-d 电磁场张量: $F^{\mu\nu} = \partial^\mu A^\nu - \partial^\nu A^\mu$

$$= \begin{pmatrix} 0 & -\frac{E_x}{c} & -\frac{E_y}{c} & \frac{E_z}{c} \\ \frac{E_x}{c} & 0 & -B_z & B_y \\ \frac{E_y}{c} & B_z & 0 & -B_x \\ \frac{E_z}{c} & -B_y & B_x & 0 \end{pmatrix}$$

$\rightarrow$ 麦克斯韦方程: $\partial_\mu F^{\mu\nu} = \mu_0 j^\nu$ ($\nu=0, 1, 2, 3$)

15) 李维势: (推导)

$$\Phi(t, \vec{r}) = \frac{q}{4\pi\epsilon_0 (r - \vec{r} \cdot \vec{v}/c)}$$

$$\vec{A}(t, \vec{r}) = \frac{q\vec{v}}{4\pi\epsilon_0 c^2 (r - \vec{r} \cdot \vec{v}/c)}$$

16. 电偶极辐射:

自场

$$\vec{E}(t, \vec{r}) = \frac{\partial \vec{r}}{4\pi\epsilon_0 r^3}$$

$$\vec{B}(t, \vec{r}) = \frac{1}{4\pi\epsilon_0 c^2} \frac{\partial \vec{v} \times \vec{r}}{r^2}$$

$$\vec{S}(t, \vec{r}) = \frac{q^2 \ddot{\vec{r}}}{16\pi^2 \epsilon_0 c^2 r^2} \sin^2 \theta \hat{n}$$

$$P(t) = \frac{q^2 \ddot{\vec{r}}^2}{6\pi^2 \epsilon_0 c^3}$$

辐射场:

$$\vec{E}(t, \vec{r}) = \frac{1}{4\pi\epsilon_0 c^2 r} \ddot{\vec{p}} \times \hat{n} \times \hat{n}$$

$$\vec{B}(t, \vec{r}) = \frac{1}{4\pi\epsilon_0 c^2 r} \ddot{\vec{p}} \times \hat{n}$$

第二章

$$\vec{A}(t, \vec{r}) = \frac{1}{4\pi} \frac{e^{i(\vec{k} \cdot \vec{R} - \omega t)}}{R} \ddot{\vec{p}}$$

$$\vec{B}(t, \vec{r}) = \vec{\nabla} \times \vec{A} = \frac{1}{4\pi\epsilon_0 c^2} \frac{e^{i(\vec{k} \cdot \vec{R} - \omega t)}}{R} \ddot{\vec{p}} \times \hat{n}$$

$$\vec{E}(t, \vec{r}) = \frac{ic^2}{\omega} \vec{\nabla} \times \vec{B} = c \vec{B} \times \hat{n} = \frac{1}{4\pi\epsilon_0 c^2} \frac{e^{i(\vec{k} \cdot \vec{R} - \omega t)}}{R} \ddot{\vec{p}} \times \hat{n} \times \hat{n}$$

$R = \vec{r} - \vec{r}_0$
场点 源内一固定点

$$\langle \vec{S} \rangle = \frac{1}{32\pi^2 \epsilon_0 c^3} \sin^2 \theta \hat{n}, \quad \langle P \rangle = \frac{1}{12\pi \epsilon_0 c^3} \ddot{\vec{p}}^2$$

$$\vec{p} = \int \vec{j}(t, \vec{r}') dV = e^{-i\omega t} \int \vec{j}(\vec{r}') dV$$

17. 经典电磁质量: $m_{em} = \frac{e^2}{8\pi\epsilon_0 r_0 c^2}$ (re 未知)

经典电磁半径: $r_e = \frac{e^2}{4\pi\epsilon_0 m c^2} \approx 3 fm$

阻尼力: $\vec{F}_s = -\frac{e^2}{6\pi\epsilon_0 c^3} \ddot{\vec{v}}$

18)

自由粒子在外加电磁场中的运动:

$$\frac{d}{dt}(m\vec{v}) = \vec{F}_e + \vec{F}_s$$

$$\ddot{x} + \gamma \dot{x} = \frac{e}{m} \vec{E}_0 e^{-i\omega t}, \quad \gamma = \frac{e^2 \omega^2}{6\pi\epsilon_0 m c^3}$$

$$\Rightarrow x_0 = -\frac{e \vec{E}_0}{m(\omega^2 + i\omega\gamma)} e^{-i\omega t} \approx_{\gamma \ll \omega} x = -\frac{e \vec{E}_0}{m\omega^2} e^{-i\omega t}$$

求 E, B → 求 <S>, P

$$r = \frac{p}{\omega}$$

⇒ 汤姆逊散射: $\sigma = \frac{8\pi}{3} r_e^2$

束缚粒子在外加电磁场中的运动:

$$\ddot{x} + \gamma \dot{x} + \omega_0^2 x = \frac{e}{m} \vec{E}_0 e^{-i\omega t}$$

$$\Rightarrow x = \frac{e}{m} \frac{1}{\sqrt{(\omega_0^2 - \omega^2)^2 + \omega^2 \gamma^2}} \vec{E}_0 e^{-i(\omega t - \delta)} \rightarrow \sigma = \frac{8\pi}{3} r_e^2 \frac{\omega^4}{(\omega_0^2 - \omega^2)^2 + \omega^2 \gamma^2}$$

①. $\omega \ll \omega_0$: 瑞利散射: $\sigma = \frac{8\pi}{3} r_e^2 \left(\frac{\omega}{\omega_0}\right)^4$

②. $\omega \gg \omega_0$: 汤姆逊散射: $\sigma = \frac{8\pi}{3} r_e^2$

③. $\omega = \omega_0$: 共振: $\sigma = \frac{8\pi}{3} r_e^2 \left(\frac{\omega}{\gamma}\right)^2$

(9) 体极化电荷密度: $\rho_p = -\nabla \cdot \vec{P}$

面: $\sigma_p = -\hat{n} \cdot (\vec{P}_2 - \vec{P}_1)$

磁化电流密度: $\vec{j}_m = \nabla \times \vec{M}$

... 线电流 ... : $\vec{I}_m = \hat{n} \times (\vec{M}_2 - \vec{M}_1)$

极化电流: $\vec{j}_p = \frac{\partial \vec{P}}{\partial t}$

电位移矢量: $\vec{D} = \epsilon_0 \vec{E} + \vec{P} = \epsilon \vec{E}$

磁场强度: $\vec{H} = \frac{\vec{B}}{\mu_0} - \vec{M} \rightarrow \vec{B} = \mu \vec{H}$

(10) 物质中的麦克斯韦方程组:

$$\begin{cases} \nabla \cdot \vec{D} = \rho_f \\ \nabla \times \vec{E} = -\frac{\partial \vec{B}}{\partial t} \\ \nabla \cdot \vec{B} = 0 \\ \nabla \times \vec{H} = \vec{j}_f + \frac{\partial \vec{D}}{\partial t} \end{cases}$$

本构关系: $\begin{cases} \vec{D} = \epsilon \vec{E} \\ \vec{B} = \mu \vec{H} \end{cases}$

欧姆定律: $\vec{j} = \sigma \vec{E} \rightarrow$ 导体适用

积分形式:

(11) 边界条件:

$$\begin{aligned} D_2^\perp - D_1^\perp &= \sigma_f \\ \epsilon_2 E_2^\perp - \epsilon_1 E_1^\perp &= \sigma_f \\ B_2^\perp - B_1^\perp &= 0 \\ \hat{n} \times (\vec{H}_2 - \vec{H}_1) &= \vec{K}_f \\ \hat{n} \times (\vec{E}_2 - \vec{E}_1) &= 0 \end{aligned}$$

$$\Rightarrow \begin{cases} \hat{n} \cdot (\vec{D}_2 - \vec{D}_1) = \sigma_f \\ \hat{n} \times (\vec{E}_2 - \vec{E}_1) = 0 \\ \hat{n} \cdot (\vec{B}_2 - \vec{B}_1) = 0 \\ \hat{n} \times (\vec{H}_2 - \vec{H}_1) = \vec{K}_f \end{cases}, \hat{n} \text{ 为介质1指向介质2.}$$

$$\begin{cases} \sigma_p = -\hat{n} \cdot (\vec{P}_2 - \vec{P}_1) \\ \vec{I}_m = \hat{n} \times (\vec{M}_2 - \vec{M}_1) \end{cases}$$

1° 介质2为真空.

电势的边界条件: $\Phi_1 = \Phi_2$

2° 交界面处无电流.

$$\Phi_1' - \Phi_1 = \Phi_2' - \Phi_2$$

3° 介质1为导体

$$\epsilon_1 \frac{\partial \Phi}{\partial n} - \epsilon_2 \frac{\partial \Phi}{\partial n} = \sigma$$

(12) 电磁波在物质中传播 (推导)

$$\begin{cases} \nabla^2 \vec{E} + k^2 \vec{E} = 0 \\ \nabla \cdot \vec{E} = 0 \\ \vec{B} = -\frac{i}{\omega} \nabla \times \vec{E} = \frac{1}{c} k \times \vec{E} \end{cases}$$

$$\Rightarrow \begin{cases} \text{平面波解: } \vec{E}(t, \vec{x}) = \vec{E}(\vec{x}) e^{i\omega t} = \vec{E} e^{i(\vec{k} \cdot \vec{x} - \omega t)} \\ \text{平均能量密度: } \langle w \rangle = \frac{1}{2} \epsilon E^2 = \frac{1}{2\mu} B^2 \\ \sim \text{能流} \sim: \langle \vec{S} \rangle = \frac{1}{2} \mu (\vec{E}^* \times \vec{H}) = \frac{1}{2} \sqrt{\frac{\epsilon}{\mu}} E^2 \hat{n} \end{cases}$$

113). 趋肤深度定义, 物理涵义. $\delta = \frac{1}{\alpha} = \sqrt{\frac{2}{\omega\mu\sigma}}$.

114). 两个唯一性定理的证明: (书上和笔记上的都掌握)

115)
$$\nabla^2 \Phi = \frac{1}{r^2} \frac{\partial}{\partial r} \left(r^2 \frac{\partial \Phi}{\partial r} \right) + \frac{1}{r^2 \sin \theta} \frac{\partial}{\partial \theta} \left(\sin \theta \frac{\partial \Phi}{\partial \theta} \right)$$

$\Rightarrow$ 通解:
$$\Phi(r, \theta) = \sum_{l=0}^{\infty} \left(a_l r^l + \frac{b_l}{r^{l+1}} \right) P_l(\cos \theta)$$

116). 边界条件:

①. $r = R_0$: $\Phi_1 = \Phi_2$

$$\epsilon_1 \frac{\partial \Phi_1}{\partial n} - \epsilon_2 \frac{\partial \Phi_2}{\partial n} = \sigma$$

②. $r \rightarrow \infty$, $\Phi_1 \rightarrow \infty$

③. $r \rightarrow \infty$, $\begin{cases} \Phi_2 \rightarrow 0 \\ \Phi_2 \rightarrow -E_0 r \cos \theta \text{ (球心为 } O \text{ 电势点).} \end{cases}$

117). $P_0(\cos \theta) = 1$

$$P_1(\cos \theta) = \cos \theta$$

$$P_2(\cos \theta) = \frac{1}{2} (3 \cos^2 \theta - 1)$$
